About Me

I'm a skilled software engineer with experience working across the stack. I've spent much of my time in both Javascript and Python, first in a modelling capacity and subsequently in creating and maintaining a full stack SaaS analytics application. I'm passionate about software engineering (and learning in general), particularly data focused applications.

Experience

Software Engineer at Kapiche (Jul 2017 - Present)
I was the second engineer hired at Kapiche, a text analytics SaaS platform for understanding customer feedback. I have been with the company from Angel through Seed. Highlights include:

- I built numerous parts of the product including the Compare queries screen, Dashboards, Quadrant chart, Integrations and Timeline chart.
- I optimised the topic modelling process in the analytics engine reducing runtime by 70%, enabling a key client to run their data.
- I implemented a feature flags system which allowed us to decouple releases from deploys and trial features for specific users. This led to an increase in pre-release feedback and fewer full-release bugs.

Data science intern at Dingo (Feb 2017 - Nov 2017)
I was part of a data science internship at Dingo in the course of completing my capstone project. I worked in a team to deliver a model to predict failure of various mine site assets (Bulldozers, drills) based on historic failure logs and oil sample data. Combining a forecaster and a classifier, we were able to predict with 76% accuracy whether an engine would fail based on historic oil sample data.

Education

Bachelor of Computer Science, QUT 2015 - 2017

GPA: 6.2 / 7
Societies & Activities: Code Network, Dean's list 2016, Code network Hackathon 2016 & 2017, New Colombo Plan Scholar, Huawei Seeds for the Future Delegate

Bachelor of Psychological Science, Griffith, 2011 - 2014

Societies & Activities: Griffith Psychological Society

Technical Skills

Software Engineering: Python (Django, Django REST, Celery, Ansible, Pandas), Javascript (ES6, VueJS, d3js, Node, Webpack), mySQL, Linux, Google Cloud, Azure, Docker, Kubernetes.

Other

Huawei Seeds for the Future (Nov 2017 - Dec 2017)
I was selected by my university (QUT) to be an Australian delegate in the Huawei Seeds for the Future program. This included a New Colombo Scholar grant. The experience consisted of language lessons at Beijing University, technical classes on Huawei's 4g infrastructure and guided tours of BGI, BYD, and Huawei's own manufacturing plants.

Fintech Startup Weekend Brisbane (2016)
Created an app, "Winston", a prototype to store RFID keys to replace smart cards. Limited by onboard hardware, but functional proof of concept was completed.
